AUTHOR:

Echim, I.T., Engineer

TITLE:

Technology of erection and welding of spherical tanks with diameters up to 20 m, of 500 and 200 m³ volumes and working pressure of 7 atmospheres

PERIODICAL:

Metallurgia și Construcția de Mașini, no. 12, 1962, 1112-1120

TEXT:

A description of a recommended procedure (based on practical experience) for the erection and welding of spherical all-welded tanks, composed of 3 zones. The sheets were manufactured by punching in spherical section, the central zone comprising 16 sheets, the top and bottom zone - 12 sheets each, the sphere being locked at the top and bottom by calottes. The tanks were supported on 8 or 6 steel pipe columns, connected to a concrete foundation. The characteristics of the steel employed are presented. The technological procedure described comprised details on the welding and support-

"Hypoxia and Oxygen Respiration in Their Effects on Shay-Ulcers of Rats."

Budapest, Honvedorvos, Vol 14, No 4, Oct-Dec 62, pp 317-320.

Abstract: [Authors' Hungarian summary] A hypoxic environment fully prevents the formation of ulcers in rats as a result of Shay-operations. Hyperoxic environment tripled the appearance of ulcerous changes resulting from the operation. Acidification of the duodenum and bilateral adrenalectomy prevented completely the enhancing effect of the hyperoxic environment. Two of 10 references are Hungarian, the rest Western.

Title : Contemporary Statu of Fur Dyeing.

Orig Pub : Bor-es cipotechn., 1957, 7, No 5-6, 111-114.

Abstract : Various factors are discussed which influence the
dyeing of furs: types and conditions of the applica-
tion of various mordants (biochromate, iron); concen-
tration of mordant, pH mediums, structure of hairs, ac-
tion of so-called "intermediate membranes". New dyes
for furs are described: "colindon" [sic] "nako-fast"
[sic] (vat dyes); "ainnia", "orazol" [sic] (acid
dyes); "celliton" and "celliton-fast" (dyes for acetate
silk). The method of their application, and an

NOTES: This book is intended for scientists and students (at the university level) conducting research on methods of measuring the temperature of plasmas.

CONTENTS: This is a collection of 28 articles dealing with the principles of plasma physics, or more specifically, with the problems of measuring the temperature of plasmas. The first 11 articles are devoted to measuring the temperature of plasmas. The next 11 articles are devoted to measuring the temperature of plasmas. The last 6 articles are devoted to measuring the temperature of plasmas. The articles are written on the following subjects: 1. The temperature of plasmas. 2. The temperature of plasmas. 3. The temperature of plasmas. 4. The temperature of plasmas. 5. The temperature of plasmas. 6. The temperature of plasmas. 7. The temperature of plasmas. 8. The temperature of plasmas. 9. The temperature of plasmas. 10. The temperature of plasmas. 11. The temperature of plasmas. 12. The temperature of plasmas. 13. The temperature of plasmas. 14. The temperature of plasmas. 15. "Direct Revascularization of Myocardium Following an Experimental Infarct in Dogs"

Prague, Casopis Lekaru Ceskych, Vol CII, No 26, 28 June 63, p 725.

Abstract: Experiments lead to the following conclusions:

1. Anastomosis between the system and coronary artery is feasible even with a pulsating heart. 2. Infarct-like changes were observed following the tying of r. interventricularis. A partial adjustment took place following anastomosis. 3. Microscopic examination showed ischemic deposits in dogs with anastomosis

1/2

CZECHOSLOVAKIA

Prague, Casopis Lekaru Ceskych, Vol CII, No 26, 28 June 63,
p 725.

in contrast to large infarcts in dogs without anastomosis.
4. A sudden inflow of blood into the ischemic deposit may be
accompanied by an immediate fibrillation of chambers. It can
be prevented by a temporary interruption of the blood flow
by means of anastomosis and its slow and interrupted liberation.

Patients with inoperable tumours and who were irresponsive to radiotherapy were subjected to therapy with 'mitomen' alone and to combined therapy with mitomen and degranol, or mitomen and sarcolysin. The results of these investigations were compared. Thirty-nine patients were treated with mitomen only. Eighteen patients showed a temporary improvement of their complaints, however, without evidence of regression of the tumours. In 6 patients a definite improvement was noted. Three of these patients were cases with cancer of the uterus. Twenty-four patients were treated with a combination of mitomen and degranol. The therapeutic results were less favourable than with mitomen alone. The authors found an adverse summation of toxic effects on the bone marrow so that no advantage could be noted with this combination. No advantages were observed in 5 patients where a combined therapy of mitomen and sarcolysin was given. Mitomen is an effective and relatively well-tolerated cytostatic substance. According to informative investigations successful results can be obtained by mitomen chiefly in cases of cancer, especially in cancer of the uterus.

Periodical: Ceskosl. casop. fys., 1956, 6, No 1, 1-8; Czech

Abstract: It is shown that the Dember scheme for measuring the additiveness of the photo emission and secondary emission is not suitable and that Dember made a mistake in explaining his experiments. The full additiveness of the photo current and secondary-electron current is experimentally demonstrated for Mg and Al. It is also shown that not too excessive a surface oxidation does not disturb this additiveness. It is shown that the phenomena observed by Shmakov in photocells with 2 cathodes can be explained as the consequence of the configuration of the electric field and the distribution of the

TITLE: Letter to the Editor: The Maximum of Thermal Emission and Photo-Emission of a Silver Caesium Photo-Cathode

PERIODICAL: Československý Časopis Pro Fysiku, 1959, Nr 2, pp 215-217

ABSTRACT: In the literature (eg Ref 1) it is usually stated that during the activation of a silver caesium photo-cathode, the maximum of thermal emission and photo emission occurs at the same time. Because it is experimentally easier to observe thermal emission, one uses the maximum in thermal emission as an indication that the activation of the photo-cathode has been completed. However, this is not always so. The current due to thermal emission It was registered and, during illumination, the photo current was measured. In our arrangement, I_{max} and $I_{\text{f max}}$ were of the same order of magnitude. The light was switched on for short periods only (approximately 1 second). It has been found that the time of activation needed to reach one maximum was usually different from that needed for the other (see Figs 1a and 1b - the dotted line shows the photo emission while

TITLE: Modern Efficient Photo Cathodes²¹

PERIODICAL: Československý Časopis Pro Fysiku, 1959, Nr 4,
pp 424-435

ABSTRACT: This is a review article dealing solely with the physical properties of only three types of photo cathodes which are very widely used and detailed information about them has been published in accessible literature. A number of important problems relating to the study of the external photo effect are not dealt with. This applies particularly to photo emission of metals (which is important from the theoretical point of view as well as from the point of view of detection of short wave radiation) and to the photo emission of semiconductors, the structure of which is better known.

TITLE: Oxidized Layers with High Secondary Emission¹
Coefficients

PERIODICAL: Československý Časopis Pro Fysiku, 1959, Nr 6,
pp 628-644

ABSTRACT: Survey of the methods of activating alloys whose active components are Mg, Be or other metals forming stable oxides, which have a high secondary emission coefficient. The physical properties of the activated alloys are discussed, particularly the causes of the high coefficient of secondary emission, the peculiarities of the energy distribution of the electrons, and the causes of fatigue. Apart from a survey of data from literature, the paper also gives some of the results obtained in the laboratory of the Department. The information is dealt with under the following chapter and paragraph headings: 1) Demands to be met by the secondary emission electrode in multipliers; 2) Considerations relating to the selection of suitable materials; 3) Alloys applied and their activation (magnesium alloys; beryllium alloys; other alloys;

Title : The Maximum Thermal Emission and Photoemission of a Silver-Cesium Photocathode

Orig Pub : Ceskosl. casop. fys., 1959, 9, No 2, 215-217

Abstract : It was shown experimentally that, in spite of the prevalent opinion that the maximum of thermal electronic and photoelectric currents in an oxygen-silver-cesium photocathode occur during the process of activation simultaneously, this may not be so. Depending on the conditions under which the activation is carried out, the maximum of photocurrent may occur earlier than the maximum of thermal emission and vice versa.

TITLE: USSR

PERIODICAL: Pokroky matematiky, fysiky a astronomie, no. 2, 1960,
218-219

TEXT: The article briefly reports on four scientific conferences which convened in the USSR in 1959. (1) The Scientific-Technical Conference on Nuclear Radiotechnical Engineering convened in Moscow on April 20-25, 1959. The conference, organized by the Glavnoye upravleniye po ispol'zovaniyu atomnoy energii (Central Institute for the Use of Atomic Energy), was attended by 800 scientists and technicians. A total of 102 reports were delivered on the following subjects: nuclear radiation detectors; amplitude and time analyzers; impulse apparatus; automation of measuring and data processing; spectrometers; voltage and current amplifiers and regulators. (2) The 6th Session of the Scientific Council of the Joint Nuclear Research Institute convened in Dubna on May 27 - June 2, 1959. The session was attended by leading nuclear physicists from 12 socialist countries. Subjects

Card 1/3

USSR

Z/028/80/000/002/005/005
D253/D304

dealt with were the structure of nucleons and the origin of mesons and antiparticles, etc. (3) The Conference on Measuring of Mechanical Quantities convened on June 13-19, 1959. Major subjects of the conference were the outlining of meteorological problems in the field of mechanical measuring; analysis of possibilities to perform mechanical measurements; evaluating accomplished studies and their practical application; etc. (4) The 9th All-Union Conference on Cathode Electronics convened in Moscow on October 21-28, 1959, and was also attended by delegates of China, the DDR, the CSSR and Hungary. The following 7 major subjects were dealt with: surface properties of solid materials; thermionic emission; photoemission; secondary emission; auto-emission and surface-ionization in strong electric fields; the properties and technology of cathodes; mutual interaction between solid materials and the stream of charged particles and/or residual gases. N. D. Morgulis reported on "Some Problems of High and Ultra-high Vacuum"; L. N. Dobrecov reported on secondary emission and inelastic electron scattering (studies performed at the Leningrad Physico-Technological Institute of the AS USSR) and on direct conversion of thermal into electrical energy; P. V. Timofeyev reported on the application of β -emission in the vacuum. The reports delivered at the conference will probably be published in two issues of the

TITLE: Field Emission from Thin Dielectric Layers

PERIODICAL: Ceskoslovensky casopis pro fysiku, 1960,
No. 5, pp. 412 - 419

TEXT: There are several known theories dealing with the field emission from thin dielectric layers. One of these was proposed by Zernov (Ref. 3) and Hippel (Ref. 4); on the basis of this theory the emission current can be expressed by Eq. (1). A second theory due to Zernov expresses the emission current by Eq. (2). Another theory is due to Jacobs and others (Ref. 9), who investigated the emission of fine layers of MgO. However, on the basis of the available experimental data it is seen that all these theories cannot be regarded as satisfactory. The problem of the field emission was investigated experimentally. The experimental tube is shown in Fig. 2. This comprises an electron gun and a collector which captures the electrons of the beam. The tube is evacuated and is furnished with a pair of parallel plates P_1 and P_2 , one of which (P_2) is covered with a thin layer of dielectric. The plates can be

Card 1/4

Z/037/60/000/005/024/056
E192/E382

Field Emission from Thin Dielectric Layers

connected to suitable potentials. First MgO was tried as the dielectric but it was difficult to obtain any consistent results. The main investigations were done with mica sheets having a thickness of 15 - 20 μm . These were measured in the circuit shown in Fig. 3. First, the dependence of the emission current on the voltage applied across the dielectric was determined. It was found that the current could be observed only when the voltage was sufficient to produce a breakdown in the dielectric. Afterwards it was possible to obtain the field emission current at much lower voltages. The stability and reproducibility of the results differ from sample to sample and depend on the voltage applied to the sample. Fig. 4 illustrates the time dependence of the current in a very unstable sample at voltages of 1 000 V and 800 V. Other samples showed considerably less variations so that their characteristics could be measured without difficulty. Most of the measurements gave similar results to those indicated in Fig. 5, where the shaded area represents the region covered by 8 measurements; the first 4 measurements were done

Card 2/4

Z/037/60/000/005/024/056
E192/E382

Field Emission from Thin Dielectric Layers

immediately after each other, while the remaining 4 were taken after a long time interval. The effect of varying collector voltage is illustrated in Fig. 6. The temperature dependence of the field emission current is illustrated in Figs. 7, where this effect was investigated indirectly and approximately. The emitting layer in this case was placed in an oven which was heated by a tungsten coil. The dependence of the emission current on times was measured for various heating currents flowing through the coil. One of the main characteristics of the emissive systems employed in the experiment is the simplicity of their construction and their mechanical strength. This is due to the fact that the dielectric layer is firmly held in its position by a grid. However, it is not clear how far the experiments are valid in explaining the physics of field emission. In order to answer this problem the system was simulated by an electronic tank, by means of which it was possible to plot the equipotentials.

TITLE: A Dynamic Electron Multiplier

PERIODICAL: Československý časopis pro fysiku, 1960,
No. 5, pp. 420 - 424

TEXT: A dynamic electron multiplier was designed on the basis of Krebs and Meerbach theory (Ref. 4). The device consisted of two rectangular dynodes and two electrodes producing a transverse field. A high-frequency field was applied to the dynodes. Some of the experimental tubes were furnished with a tungsten helix which was situated in the vicinity of the negative electrode and served as a source of primary electrons. The positive electrode served as a collector. The distance between the dynodes was 2 cm and the length was 7 cm. The electrodes were made of non-activated beryllium bronze. In order to obtain the secondary emission coefficient greater than unity, the energy of the incident electrons had to be higher than 100 eV. Under the assumption that the average energy of the electrons is 4 eV, it was calculated that at the frequency of 120 Mc/s the amplitude can change between 200 and 650 V. The primary electrons were

83384

Z/037/60/000/005/025/056
E192/E382

A Dynamic Electron Multiplier

provided either by a tungsten cathode or by the photo-emission produced by ultra-violet radiation (the multipliers were fitted with a silica window). The tubes were evacuated by means of an oil diffusion pump and then gettered, so that the internal pressure after sealing off was 10^{-8} to 10^{-9} mm Hg. The measurement circuit employed in the experiments is shown in Fig. 2. The auxiliary devices such as the high-frequency oscillator, voltmeter and DC amplifier were specially constructed for the measurements. The operating region of the multiplier lies between 80 and 130 Mc/s. This is illustrated in Fig. 3, where Curve 1 shows the mean amplitude U_0 , at which the multiplication occurs; Curve 2 correspond to the maximum collector current, while Curve 3 denotes the region at which there is no multiplication. Curves 4 and 5 in Fig. 3 represent an additional operating region but this was found to be very unstable. The dependence of the output current on the transverse voltage (the primary current being constant) is illustrated in Fig. 4. Fig. 5 shows the effect of the collector current on the primary current; it

Card 2/3

83384

Z/037/60/000/005/025/006
E192/E382

A Dynamic Electron Multiplier

is seen that the relationship is linear only over a certain region. Fig. 6 gives the dependence of the collector current on the amplitude at the frequency of 130 Mc/s. The maximum multiplication which could be obtained with the device was 5 000. From the experiments it is concluded that the principle of the dynamic electron multiplication can successfully be employed in electron multipliers but the maximum amplification is limited by the principal stable value of the secondary emission coefficient of the dynodes and the critical value of the transverse field at which the self-excitation of the system may occur. The system is also disadvantageous in that it requires a very good vacuum and cannot be easily used for the amplification of pulse signals.

TITLE: The Ninth All-Union Conference on Cathode Electronics

PERIODICAL: Slaboproudý obzor, 1960, Vol 21, No 2, pp 125-126

ABSTRACT: The conference took place during October 21-28, 1959, in Moscow at the Institute of Radio Engineering Electronics of the Soviet Academy of Science. Over 120 papers and communications were read and the conference was attended not only by the Soviet specialists but also by representatives of China, Eastern Germany, Czechoslovakia and Hungary. During the plenary session of the conference a number of papers were read which were primarily concerned with the future developments of cathode electronics. The work of the conference was divided into the following sections:

- (1) Surface properties of solids.
- (2) Thermal emission.
- (3) Photo-emission.

Card 1/2 (4) Secondary emission.
